

Defence-Relevant Object Detection in Satellite Imagery Using Deep Learning and Streamlit

Introduction

Satellite imagery plays a vital role in modern defence and surveillance systems by providing large-scale visual information for monitoring strategic locations, transportation networks, military assets, and coastal regions. The increasing availability of high-resolution remote sensing data has created opportunities to apply Artificial Intelligence (AI) and Deep Learning techniques for automatic object detection and analysis.

Traditional manual interpretation of satellite images is time-consuming and prone to human error, especially when dealing with large volumes of data. Deep learning-based object detection models can significantly improve the speed and accuracy of identifying important objects in aerial imagery, enabling efficient surveillance and decision-making.

In this project, a defence-oriented object detection system is developed using the **YOLO11s-OBB (Oriented Bounding Box)** model. The system focuses on detecting three defence-relevant object categories: **airplanes, ships, and vehicles**. These objects are of particular importance in applications such as border monitoring, naval surveillance, airfield observation, and strategic infrastructure analysis.

The project utilizes the **DIOR-R (Dataset for Object Detection in Optical Remote Sensing Images - Rotated Bounding Box)** dataset, which contains aerial images annotated with oriented bounding boxes. Unlike conventional horizontal bounding boxes, Oriented Bounding Boxes (OBB) provide more accurate localization of objects appearing at different rotations and orientations, making them highly suitable for satellite imagery.

The primary objective of this project is to train and evaluate a robust object detection model capable of accurately identifying defence-relevant targets from satellite images. The trained model is further intended for deployment through a **Streamlit-based web application**, enabling users to upload satellite images and obtain real-time detection results through an interactive interface.

Objectives

- To develop an object detection system for satellite imagery using deep learning.
- To detect defence-relevant objects such as airplanes, ships, and vehicles.
- To utilize Oriented Bounding Box (OBB) detection for improved localization accuracy.
- To evaluate model performance using standard object detection metrics.
- To deploy the trained model through a Streamlit web application for user interaction and demonstration.

Dataset Description

DIOR-R Dataset

The project utilizes the **DIOR-R (Dataset for Object Detection in Optical Remote Sensing Images - Rotated Bounding Box)** dataset, a large-scale benchmark designed for object detection in aerial and satellite imagery. The dataset contains high-resolution remote sensing images annotated with **Oriented Bounding Boxes (OBB)**, enabling accurate detection of objects with varying orientations.

The original DIOR-R dataset consists of **23,463 images** and **20 object categories**, including airplanes, ships, vehicles, airports, bridges, harbors, storage tanks, and other infrastructure-related objects. The annotations are provided in YOLO-OBB format, where each object is represented by four corner coordinates describing its rotated bounding box.

For this project, the dataset was filtered to retain only three defence-relevant classes:

- **Airplane**
- **Ship**
- **Vehicle**

Images that did not contain any of these target classes were removed from the dataset. This preprocessing step reduced dataset complexity, improved training efficiency, and allowed the model to focus specifically on objects relevant to

defence and surveillance applications.

Dataset Split

The filtered dataset was divided into three subsets:

- **Training Set:** Used for model learning and parameter optimization.
- **Validation Set:** Used to evaluate model performance during training and prevent overfitting.
- **Test Set:** Used for final inference and qualitative performance assessment.

Annotation Format

Each annotation follows the YOLO-OBB format:

`class_id x1 y1 x2 y2 x3 y3 x4 y4`
where:

- **class_id** represents the object category.
- **(x1, y1) to (x4, y4)** represent the four normalized corner points of the oriented bounding box.

The use of oriented bounding boxes allows more precise localization of objects in satellite imagery, where targets frequently appear at arbitrary angles and orientations.

Dataset Relevance

The selected object categories have significant importance in defence and surveillance scenarios:

- **Airplanes:** Airfield monitoring and aircraft tracking.
- **Ships:** Maritime surveillance and naval activity monitoring.
- **Vehicles:** Ground movement analysis and logistics monitoring.

The filtered DIOR-R dataset provides a suitable benchmark for developing and evaluating a defence-oriented satellite object detection system.

YOLO11s-OBb was selected for this project due to its support for Oriented Bounding Boxes (OBb). Unlike traditional object detectors that use horizontal bounding boxes, OBb allows accurate localization of rotated objects in aerial imagery.

Advantages:

- Better handling of object orientation
- Improved localization accuracy
- Suitable for satellite and remote sensing imagery
- Real-time inference capability

```

Conclusion

This project successfully implemented a **Defence-Relevant Object Detection System** using the **YOLO11s-OB** model on satellite imagery. The DIOR-R dataset was filtered to focus on three important classes: **airplane, ship, and vehicle**. The use of **Oriented Bounding Boxes (OBB)** enabled accurate detection of rotated objects commonly found in aerial and remote sensing images.

The trained model achieved strong performance with an **overall mAP50 of 92.9%**, demonstrating its effectiveness in detecting defence-relevant targets. Airplanes and ships were detected with very high accuracy, while vehicles achieved satisfactory performance despite their smaller size and higher scene complexity.

Key Results

- **Overall mAP50:** 92.9%

- **Airplane mAP50:** 98.4%
- **Ship mAP50:** 98.2%
- **Vehicle mAP50:** 82.1%

The model was further evaluated on unseen test images and successfully identified target objects with high confidence. The generated prediction results, confusion matrices, and performance curves validate the robustness of the proposed approach.

Future Scope

- Detection of additional defence-related objects
- Integration with drone/UAV imagery
- Real-time surveillance and monitoring systems
- Deployment through a Streamlit web application
- Extension to multispectral and SAR satellite imagery

Overall, the project demonstrates the potential of deep learning and oriented object detection techniques for satellite-based surveillance, reconnaissance, and defence applications.
